## November 2005

Published_Applications Nucleic Acid and Published_Applications Amino Acid database searches now generate two sets of results each. The Published_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published_Applications_New databases; older published applications make up the Published_Applications_Main databases.

Searches run against Nucleic Acid Published_Applications produce two sets of results, with the extensions .rnpbm (Published_Applications_NA_New).

Searches run against Amino Acid Published_Applications produce two sets of results, with the extensions .rapbm (Published_Applications_AA_New).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Direct Submission Called Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Nov 15, 2002 this sequence version replaced gi:23912386. The sequence in this assembly is a combination of BAC based reads and whole genome shocgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.kcm.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table. ----- Genome Center

```
NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a working draft's sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
This sequence will be replaced

On Sep 19, 2002 this sequence version replaced gi:21744222.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and the feature table.

3 (bases 1 to 234153)

5 Rat Genome Sequencing Consortium.

Direct Submission

Loudocular and Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 15, 2002 this sequence version replaced gi:22857240.

The Sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the fature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold', Mithin each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Center: Baylor College of Medicine Center code: BCM

The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatotoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.
                                                                                                                                                                                                        Determining if a compound induces a toxic effect on a tissue or cell, for identifying hepatotoxic compounds, comprises comparing a gene expression profile of a tissue or cell sample to a database of Tox mean and non-Tox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat; insulinoma differentially expressed clone; ss; glucose response;

The invention relates to an isolated polymucleotide (differentially expressed by Insulinoma cells) encoding a protein involved in regulating expressed by Insulinoma cells) encoding a protein involved in regulating clauses responses. Also included are an expression cassette (comprising the polymucleotide and a promoter, where the polymucleotide is positioned to oil gonucleotide of 15-50 bases (comprising 15 or more bases of polymucleotide encoding the polymptide, a method of expressing a polymucleotide, a polypeptide comprising the heterologous polymucleotide, a polypeptide comprising a sequence encoded by the polymptide of 5-15 residues comprising 5 or more consecutive residues of the polypeptide, a monoclonal antibody that binds immunologically to the polypeptide, a mucleic acid encoding the antibody, composition, where the antibodies bind immunologically to the polypeptide, a method for medulating the glucoseresponsiveness of a cell, a method of screening for a modulator of the polypeptide and a method for measuring the expression of the polypeptide and a method for measuring the consecutive in the polypeptide and a method for measuring the cell that secrets insulfn, and as target for drug screening or diagnostic indicator for the loss of glucose-responsiveness in a host cell that secrets insulfn, and as target for drug screening or diagnostic indicator for the loss of glucose-responsiveness en in diabbetes. The present sequence is an isolated polymucleotide (differentially expressed by the polymptide and protein involved in regulating glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; insulinoma differentially expressed clone; ss; glucose response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotide, useful for enhancing, stabilizing or introducing

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polymuclectide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis), infectious disorders (e.g. multiple sclerosis), blood disorders (e.g. precedents), altergic conditions (e.g. asthma), neurodegenerative disorders (e.g. Alzheimer's disease), liver fibrosis, coagulation disorders (e.g. Alzheimer's disease), liver fibrosis, sequences of the invention are also useful in gene therapy. ABK3610-captesent the cDNA sequences of the invention that encode for

Primer sets for synthesizing polymucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

WPI; 2001-318749/34.

```
The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence of the complementary to a polynucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence of and the complementary full-length cDNAs. The primers are also useful for the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH0362 to AAH13628 and AAH13613 to PAH13612 represent human amino acid sequences; and AAH0362 to AAH13622 represent human amino acid sequences; and AAH0362 to AAH0362 represent complementary and the exemplification of the

Six hundred and twenty three polynucleotides derived from a variety of human tissue sources which encode secreted proteins, useful for treating

WPI; 2002-179322/23.

which encode human secreted proteins. The convention also provides a derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis), infectious disorders (e.g. hamanatory disorders (e.g. arthritis), infectious disorders (e.g. hamanatory disease), liver fibrosis, coagulation disorders (e.g. haemophila), and tumours. The polynucleotide sequences of the invention are also useful in gene therapy. DNA replication and repair associated proteins (DRASP) and their antigonists are useful for treating or preventing a disease associated with increased expression or activity of DRASP. These disorders include development disorders e.g anemia, epilepsy, hypothyroidism, proliferative disorders including cancer; autoimmune/inflammatory disorders including AIDS, atherosclerosis, autoimmune thyroiditis; bronchitis; allergies and asthma. The DRASP s and the polymucleotides encoding them are also useful for diagnosis of the above mentioned disorders. Catalytic or immunogenic fragments of the DRASP or its oligopeptides can be useful for screening libraries of compounds in a variety of drug screening techniques

The polynucleotide sequences given in AAC93364 to AAC93412 encode the human secreted proteins given in AAB51620 to AAB51668. AAB51669 to AAB51722 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present

Invention, numan secreted processes activities based on the tissues and cells the genes are expressed in. Examples of activities include: antiarthritic; immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; cerebroprotective; antibacterial; virucide; fungicide; and controprotective; antibacterial; virucide; fungicide; and be used to pervent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmume diseases, hyperproliferative disorders, cardiovascular disorders, angiogenesis, nervous system clisorders, infections caused by bacteria, viruses and fungi and ocular disorders. Infections caused by bacteria, viruses and fungi and ocular clisorders in polypoptides can also be used to aid wound healing and ceptimelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of polypoptides can also be used as alion be used to preservative to increase or decrease storage capabilities. AAC93355 to AAC93363 and AABS1619 represent sequences which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprises a 3'-end sequence of an oligonucleotide comprises a 3'-end sequence of the 5'-end sequence and an oligonucleotide comprises a 3'-end sequence of polynucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence in selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH13612 for AAH13613 to AAH13613 represent human amino acid sequences; and AAH13623 to AAH13612 represent complementary and in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention

Isolated nucleic acid molecules encoding novel ovarian polypeptides,

```
The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens or polymucleotides, antibodies against human ovarian antigens, and the use of ovarian polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoes), endocrine disorders, infertility, disorders (e.g., mastitis, oophoritis and cysts, and dysmenorrhoes), inflammatory conditions (e.g., mastitis, oophoritis and conditions (e.g., mastitis, oophoritis and conditions (e.g., mastitis, oophoritis and using should alsorders (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and conditions (e.g., anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and conditions (e.g., anaemia), cardiovascular disorders and urinary system tisorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used as food additives or to prepare antibodies therefor in disease diagnosis, drug targeting and phenotyping. The present colypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present colypeptides may be used as food additives or to prepare antibodies conversed to the printed specification, but was obtained in electronic format directly from WIPO at ftp.whpo.int/published_pot_preserver.

WPI; 2003-103412/09. P-PSDB; ABU70437 complex between two interacting proteins in adipocyte cells, useful identifying selected interacting domains that modulate protein gractions, or for preventing or treating metabolic disorders such as New complex between obesity or diabetes interactions,

Claim 7; Page 134-138; 382pp; English.

The invention relates to a complex between two interacting proteins in adipocyte cells, given in the specification. The proteins are identified by selecting a bait protein from a known adipocyte marker and then performing a peak 2-hybrid selection to isolate prey proteins are cooled by commence of an adipocyte cDNA library. The proteins are designated SID (RTM) (selected interacting domains) proteins. Also included are a polymeptide encoding a polymeptide in the adipocyte cells, a complex, selecting a modulating compound in adipocyte cells, a SID (RTM) polymeptide comprising any of the 738 amino acid sequences given in the specification (including its fragment or variant), cells, a SID (RTM) polymelectide comprising any of the 738 nucleotide sequences given in the specification (including its fragment or variant), comprising the SID (RTM) polymuloctide, a recombinant host cell comprising the vector, a protein chip comprising the polymeptides and a record comprising all or part of the data, listed in the specification. The complex, polymeptides, polymelectides and compounds are useful for the complex, polymeptides, polymelectides and compounds are useful for man encoded the second comprising or treating or treating or treating or treating metabolic disorders such as observed the second comprising or treating or treating or preventing or treating or treating or preventing or treating or protein complex, when the specification comprised the second comprised The polynucleotides are useful as probes or primers. The complex is particularly useful for identifying selected interacting domains (SI (RTM)) for screening drugs that modulate the protein interaction, the exhibiting the therapeutic effect. The present sequence encodes a SI (prey) protein of the invention

```
The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, crohif a disease, ischaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodaling. (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptides. (I) induces the proliferation of neutral cells and regeneration of nerve and brain tissue and is useful for the treatment of central and compared in addition, (I) is involved in chemotactic or chemokinetic sclerosis. In addition, (I) is involved in chemotactic or chemokinetic cortismes. The polyment and for regeneration of haematopoiesis and is useful for treating myeloid or lissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, cor periodontal disease. Purthermore, (I) is also useful for gut protection or regeneration and treatment of lung or liver invarious fimmine deficiencies and its unique immine and cortismes and cortismes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reperfusion or regimenation and treatment or 1 mag of 1104 1101019; protection of regimenation and treatment of 1 mag of 1104 intercions and combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple scienciss, in remarking a matching severe combined immunodeficiency (SCID), bacterial or remarking a tribritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (1) affects biorhythms or circadian cycles of thythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides activity and can act as an anigen in a vaccine composition to raise an immune response. AAS44929-AAS45295 represent novel human secreted protein

The sequence tag present in the cDNA between the NoII site and the oligo-dT track served to identify it as a clone from the normalized arrium at 16.5 dpc library cDNA library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 141-278, SKSINEL#SINE/B4 (BS 302-483, >MER31B#LTR/MER4-group

Inter="Gorgan: Bye; Vector: pCWVSPORT6; A human lens
library (by) was normalized by self-subtraction. One
portion of double stranded plasmid DNA representing the
library was linearized by Norl. This Norl digested library
was used as a template for biotinylated RNA synthesis
using SP6 RNA polymarses. Another portion of the double
stranded plasmid library was converted to single-stranded
circles in vitro using Gene II and Exonuclease III (Life
Technologies). Single-stranded DNA (1 mg) was hybridized
(Cut 500) with 41 mg of Bio-RNA and vector blocking
oligonuclectides. The Hybridized Bio-RNA/ss-circles were
removed by streptavidin;phenol extraction. EST analysis
was performed on the library at the NIH Intramural
